The history and evolution of AI has shaped Case-Based Reasoning (CBR) research and applications. We are currently living in an upswing of AI. To what degree does that mean an upswing of CBR as well? And what buttons should we push in order to increase the influence of CBR within the current AI summer, and beyond?

Artificial Intelligence as a scientific field was established at a Dartmouth College seminar in 1956, but ever since ancient times the idea of thinking as a formal and mechanistic process has occupied people's minds. After the firing of the starting shot in 56, the field has experienced both summers and winters, including two serious AI winters up to now. The causes behind these shifts in seasons have been subject to substantial discussion, and a compelling question of course is what to learn from this.

Case-Based Reasoning has had its own development history within the broader AI field. The grouping of AI methods into data-driven AI and knowledge-based AI [1] is also a familiar distinction in CBR. Recent trends in AI has clearly favoured the data-driven methods, and the well-known successes of Deep Neural Networks is a justification for that. But in order to widen the scope of AI methods, and be able to address a wider range of problems and applications, there are reasons to believe that a stronger knowledge-based influence will be needed in the years to come. Several authors have claimed we should look beyond the current upswing of AI, some have argued for methods inspired by human cognition, and others for a need to revitalize symbol-processing based on explicit knowledge representation. Pat Langley started the Cognitive Systems Movement [5], aimed at getting AI back to its roots of studying artefacts that explore the full range of human intelligence. The Artificial General Intelligence initiative addresses thinking machines with full human capabilities and beyond [3]. A focus on symbolic AI and knowledge representation issues has been strongly advocated by Hector Levesque [6], who also warns us to not to be blinded by short-term successes of particular methods.

Initiatives such as these are important to be aware of when we discuss future paths for CBR, and AI more generally. Moreover, the upswing of AI has created in the public, media, and decision makers a great confusion as to what AI is, where numerous concepts — AI, robots, ML, deep learning, and big data, together with the "smart" adjective before almost anything — are conflated and used interchangeably.

So, where is CBR in the overall AI landscape today? Does it live its own life alongside other main subareas, or are there sufficient similarities at the foundational level to group CBR with other methods? With a focus on machine learning, a division of the ML field into five "tribes" has been suggested [2], within which one such tribe is the "Analogizers", united by their reliance on similarity assessment as the basis for learning. It is a diverse tribe covering analogical reasoning, instance-based methods, and support vector machines. For

Invited talk, extended abstract

each of the five tribes a unifying 'master algorithm' is proposed, and some people may fall off their chairs when kernel machines is assigned as the unifying method for this tribe. Anyway, views like this may trigger discussions that will lead to a better understanding of CBR in relation to other AI methods.

Given the growing interest in cognitive foundations of AI, we recall the notions of System 1 and System 2 in human cognition presented by Kahneman [4]. System 1 is a model of human memory capable of 'fast thinking', basically performing recognition of new inputs and responding intuitively, while System 2 models the deliberate, explicit reasoning performed by humans. An important issue to discuss is how they could be related to an integrated view of CBR encompassing both data-driven and knowledge-intensive processes.

All these considerations open up some important future challenges and opportunities for CBR, including: How to interpret the revitalized cognitive turn in the paradigm of CBR? How can data-driven CBR be competitive with current ML developments? Can CBR offer a new kind of synergy of data-driven and knowledge-intensive approaches for AI?

"Silver bulletism"

"As a field I believe that we tend to suffer from what might be called *serial silver bullitism*, defined as follows:

the tendency to believe in a silver bullet for AI, coupled with the belief that previous beliefs about silver bullets were hopelessly naïve."

(Hector Levesque, Research Excellence Lecture, IJCAI 2013)

No tricks!

- We should avoid being overly swayed by what appears to be the most promising approach of the day.
- We need to return to our roots in Knowledge Representation and Reasoning *for* language and *from* language.
- We should carefully study how simple knowledge bases might be used to make sense of the simple language needed to build slightly more complex knowledge bases, and so on.
- It is not enough to build knowledge bases without paying closer attention to the demands arising from their use.
- We should explore more thoroughly the space of computations between fact retrieval and full automated logical reasoning.

(Levesque, 2013)

The Cognitive Systems Movement

The Cognitive Systems Movement

Most of the original challenges still remain and provide many opportunities for research.

Because "AI" now has such limited connotations, we need a new label for research that:

Artificial General Intelligence

Artificial General Intelligence (AGI) is an emerging field aiming at the building of "thinking machines", that is, general-purpose systems with intelligence comparable to that of the human mind. While this was the original goal of Artificial Intelligence (AI), the mainstream of AI research has turned toward domain-dependent and problem-specific solutions; therefore it has become necessary to use a new name to indicate research that still pursues the "Grand AI Dream". Similar labels for this kind of research include "Strong AI", "Human- level AI", etc.

We do not know how far we are from Artificial General Intelligence

The main reason for this lack of previsibility is simple: there are not Published on August 1, 2016 enough people working on AGI, because most of the people are André Luis Paraense Follow Postdoctoral Research Scientist @ UNICAMP / Mobile Full St Working on some kind of "narrow AI", aimed at resolving specific tasks. Abstract

In recent years broad community of researchers has emerged, focusing on the original ambitious goals of the AI field - the creation and study of software or hardware systems with general intelligence comparable to, and ultimately perhaps greater than, that of human beings. This paper surveys this diverse community and its progress. Approaches to defining the concept of Artificial General Intelligence (AGI) are reviewed including mathematical formalisms, engineering, and biology inspired perspectives. The spectrum of designs for AGI systems includes systems with symbolic, emergentist, hybrid and universalist characteristics. Metrics for general intelligence are evaluated, with a conclusion that, although metrics for assessing the achievement of human-level AGI may be relatively straightforward (e.g. the Turing Test, or a robot that can graduate from elementary school or university), metrics for assessing partial progress remain more controversial

and problematic.

Keywords: AGI, general intelligence, cognitive science

1. Introduction

How can we best conceptualize and approach the original problem regarding which the AI field was founded: the creation of thinking machines with general intelligence comparable to, or greater than, that of human beings? The standard approach of the AI discipline (Russell and Norvig, 2010), as it has evolved in the 6 decades since the field's founding, views artificial intelligence largely in terms of the pursuit of discrete capabilities or specific practical tasks. But while this approach has yielded many interesting technologies and theoretical results, it has proved relatively unsuccessful in terms

Daniel Dennett:

Competence vs. Comprehension

"competence without comprehension"

Just as computers can perform complex calculations without understanding arithmetic, so creatures can display finely tuned behaviour without understanding why they do so.

Does comprehension matter?

Do we want post-comprehension "science"? Technological competence without comprehension?

Or DARPA's "explainable Al" initiative . . . ?

out of them? PRO: So they can explain their reasoning to us. So they can develop their own imaginative curiosity, and epistemic goals.

Should we try to make persons

CON: They will blur the lines of moral responsibility.

Deep Learning Facts

(Joan Serrà, Telefonica R&D) https://vimeo.com/album/4516480/video/211630902

- High Accuracy/performance
- No Feature Engineering (ML development speedup)
- Less "Complexity" and Specifications in Design
- Scale with Large Data (ML performance saturation)
- Transfer Learning (e.g. from numbers to letters)
- Flexibility (combining building blocks)
- "Unlikely" Learning (case-based learning of addition from images)
- Generative by Nature (generate new data similar to input date)

Supervised/Unsupervised Learning

- Unsupervised learning as dimensionality reduction
- Unsupervised learning as feature engineering
- the synergy of combining supervised /unsupervised learning
 - clustering + kNN
 - MF (Matrix factorization) à la PCA
 - Unsupervised = (1) Dimensionality reduction + (2) clustering
 - Supervised (labeled targets ~ regression)

Xavier Amatriain (Quora)

Supervised/Unsupervised Learning

- Core "trick" in Deep Learning is how to combine Supervised/Unsupervised Leaning
 - E.g. Stacked Autoencoders
 - E.g. training convolutional nets

Xavier Amatriain (Quora)

10 More Lessons (Learned from building real-life Machine Learning Systems)

ConvNet

Training using Backpropagation

Process I: convolution, ReLU (rectified linear unit) and pooling operations along with forward propagation in the Fully Connected layer

Process 2: measure total error and backpropagate (adjust weights)

ConvNet

Challenge I

Given
a task/goal specifying output/solution
cases/instances/examples/(i,o) pairs

Discover automatically from the given data
 similarity measure
 relevant features
 Memory

Challenge I

CBR is viewed as integrating "learning" and "problem solving". We should widen the scope to integrate recognition tasks and deliberative tasks

"To Generalize is to be an Idiot; To Particularize is the Alone Distinction of Merit" **William Blake**

(comment to Joshua Reynolds' writings)

Analogy & Cognition

Analogy and categorization are the same: "There is no fundamental difference between a <u>single memory</u> trace (instance/ entity) and a <u>category</u> (concept)" E.g. "The *moons* of Jupiter"

> Analogy as the core of cognition Douglas Hofstadter

Challenge 2

- Today's AI need thousands of examples.
- How to learn from only one or two?
 - Better understanding the relations between CBR and
 - Analogy?
 - 'XAI'?
 - One-shot learning?

Discussion

- How relevant is the new cognitive turn for CBR?
- What role can CBR play in the current upswing of AI?
- Can CBR offer a *new kind of synergy* of data-driven and knowledge-intensive approaches to AI?
- Other new challenges for CBR should we focus on?
