Hello Nardine,

we are currently working on the implementation of the Academic Reputation Calculation in Python/ConfMaster.

The current state is available here: https://gist.github.com/thomas-preuss/0011329a8b80cd2c055a4be85b43f7a4

Could you please have a look on the current state? Further we need support with calculate_reviewer_reputation / Algorithm 4a / line 102: what do you mean by avg judgement? Is this the average of a single judgement calculated from the set of judgement criteria?

If you like, we can also skype (Thomas.preuss)

Best, Thomas
